Natural interaction with the environment

how human or animals interact with the environment

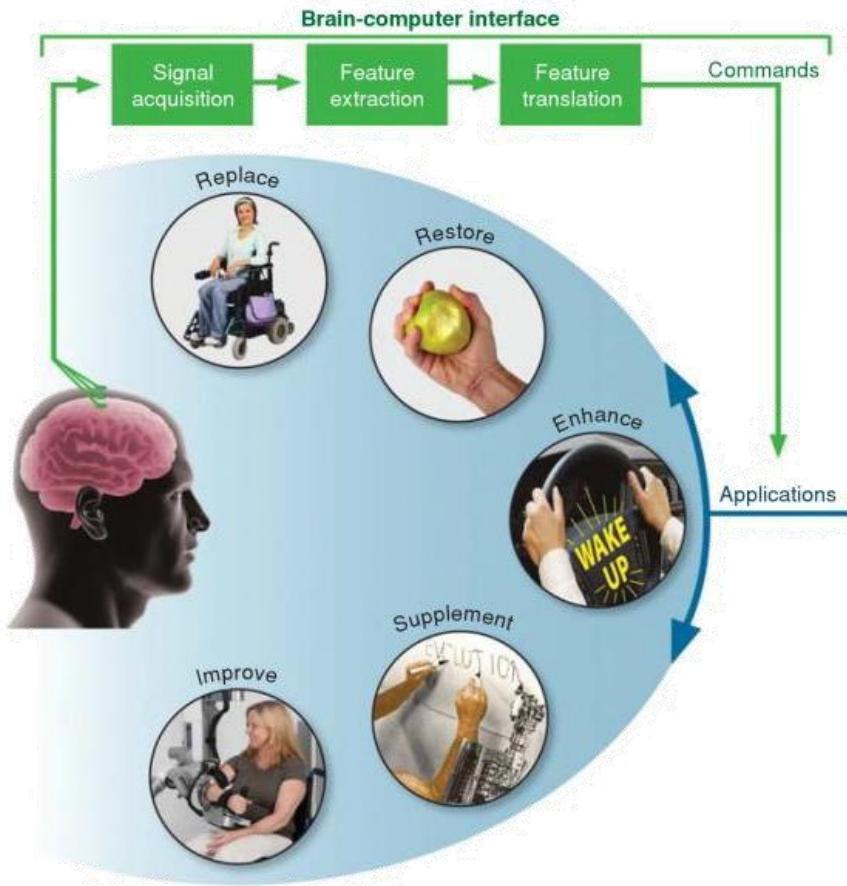

Natural and BCI outputs

really it includes also the spinal cord, but we intend the brain

Control Nervous System: allows any animal to interact with the environment

- The **natural** CNS function is to produce muscular and hormonal outputs that act on the outside world or the body.
- BCIs require the CNS to produce entirely new, **artificial** kinds of outputs, far from its natural function.

What a Brain-Computer Interface is

A BCI is a system that measures CNS **activity** and converts it to **artificial** output that replaces, restores, enhances, supplements, or improves natural CNS output and thereby changes the ongoing interactions between the CNS and its external or internal environment

Wolpaw and Wolpaw, 2012

Assistive Technology Service at FSL – BCIs at work...

The screenshot shows the official website of Fondazione Santa Lucia. The top navigation bar includes links for "Dove Siamo", "Numeri Utili", "Ufficio Stampa", social media icons, and a search bar. Below the header, there are main menu categories: "Fondazione", "Servizi Sanitari", "Ricerca", "Formazione", and "Sport". A secondary navigation bar under "Servizi Sanitari" lists "Hospital Services", "SARA-t: Servizio di Ausilioteca per la Riabilitazione Assistita con Tecnologia", and other service links like "Cerca un Medico", "Prenota Visite ed Esami", "Cancella una Prenotazione", "Richiedi un Ricovero", and "Richiedi una Cartella Clinica". The main content area features a large image of a person using a specialized communication device connected to a computer monitor. The monitor displays a colorful cartoon character and a speech bubble with the text "ciao, vorrei parlarti".

Potenziamento della Comunicazione e dell'Interazione con l'Ambiente

SARA-t è il Servizio specializzato della Fondazione Santa Lucia per l'utilizzo di tecnologie che aumentano le possibilità di comunicazione e interazione con l'ambiente da parte della persona disabile. È composto da un'équipe multidisciplinare di medici specialisti, bioingegneri, terapisti della neuropsicomotricità e terapisti occupazionali esperti di Comunicazione Aumentativa Alternativa (CAA).

Tecnologie e Obiettivi di SARA-t

Nell'ambito della terapia occupazionale, che aiuta la persona disabile a recuperare capacità di azione in molteplici ambiti della vita quotidiana, SARA-t è focalizzato su strumenti ad alto contenuto tecnologico. Mira con essi a potenziare le facoltà della persona disabile nei seguenti ambiti:

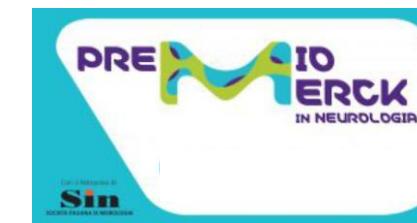

The screenshot shows the "SARA-t: Servizio di Ausilioteca per la Riabilitazione Assistita con Tecnologia" page. It features the same header and navigation as the main website. The main content area includes the heading "SARA-t: Servizio di Ausilioteca per la Riabilitazione Assistita con Tecnologia", a "Descrizione Servizio" button, and a "Come Accedere" button. Below this, there is a section titled "Tecnologie e Obiettivi di SARA-t" with a detailed description of the service's goals and technologies.

[Descrizione Servizio](#) [Come Accedere](#) [Equipe](#) [Tariffe](#) [Informazioni](#)

- Brain-Computer Interface as an alternative channel to access Assistive Technologies for communication disorders is **not currently available** in the AT-centers portfolio.
- A step forward such availability would consist in BCIs **integration with existing AT inputs** thus, resulting in a personalized hybrid BCI-based communication device.
- To generate **profiles of patients** that would potentially use the BCI as an additional/alternative channel for AT-access.

Restore: BCIs to improve recovery from brain injuries

another approach is to reinforce the Natural NN that control the movement of our arm by performing motor imagery

when we can't move a part of the body, but the part is present, the problem is the brain

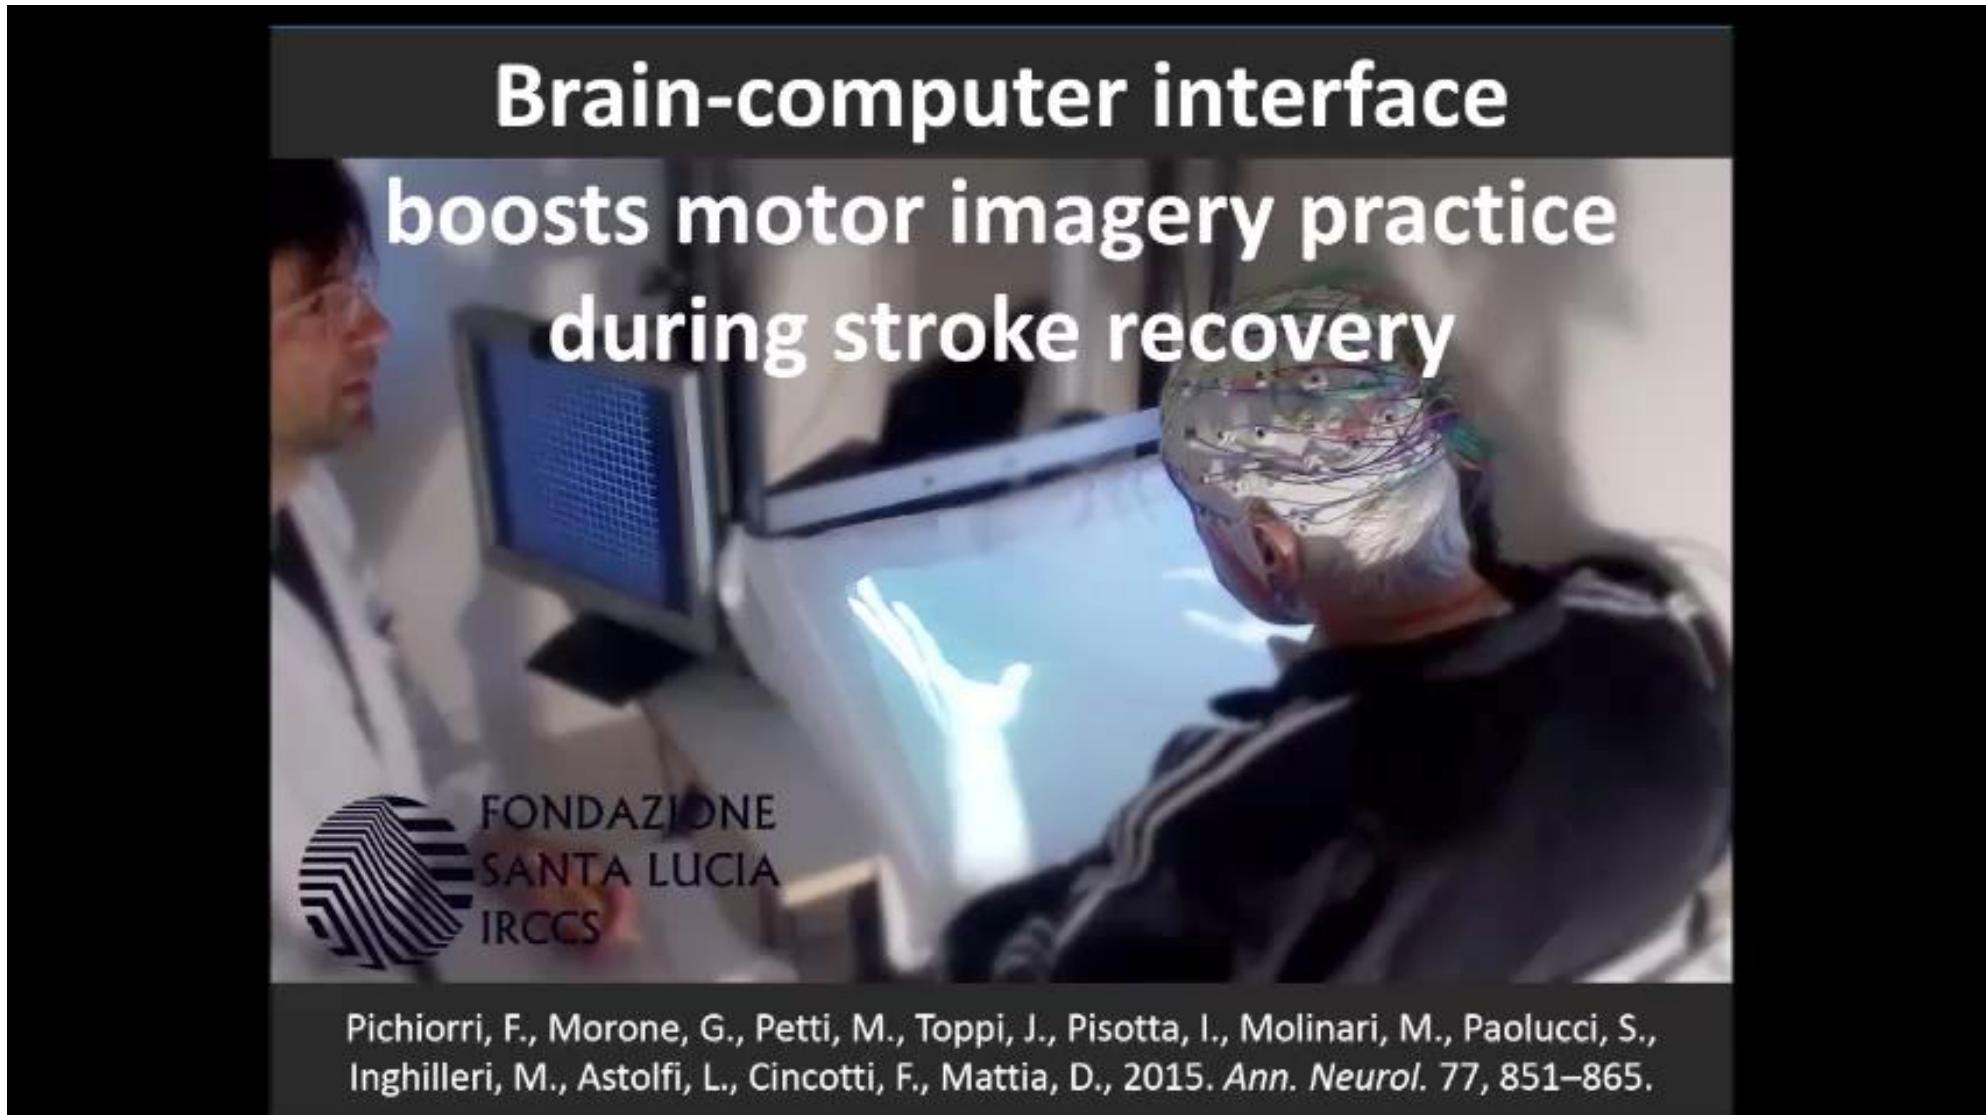

The promise of BCIs in neurorehabilitation medicine – Rehabilitative BCIs

Neurorehabilitation

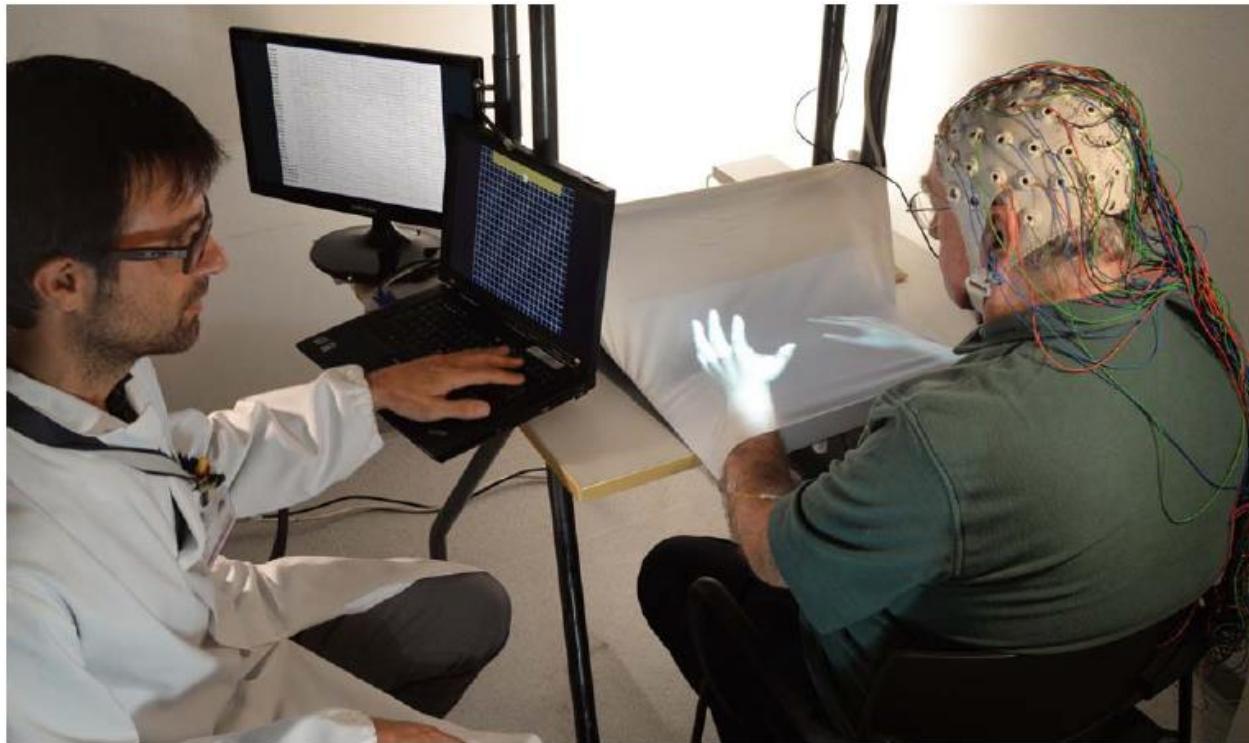

- Extensive task-oriented training program
- Feedback on (overt) performance
- Adherence to intervention
- Retraining brain areas associated to function
- Enhance neuroplasticity

BCI technology

- Can directly measure signals from (damaged) cortical areas and translate them into close-to normal motor outputs providing online feedback on performance
- BCI –based training can thus, promote re-training of brain activity and induce adaptive plasticity

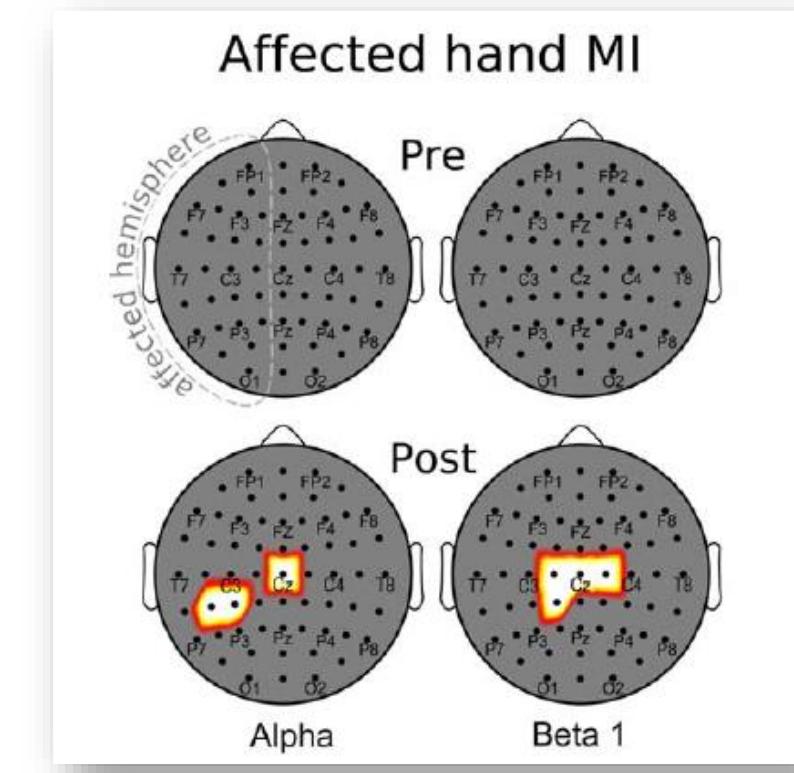

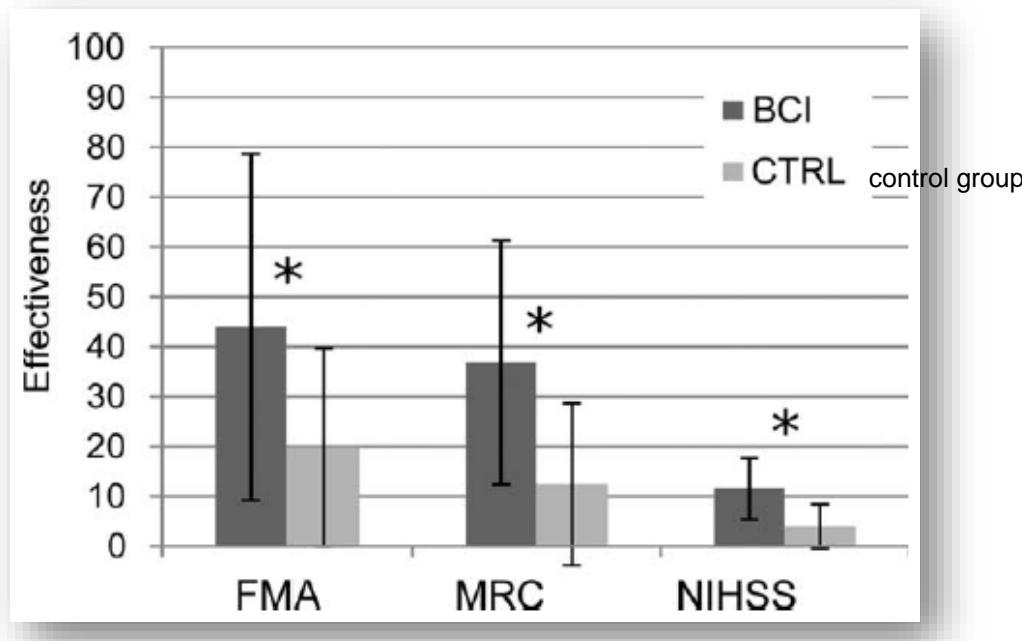

BCI based training to practice MI

BCI prototype installed in a rehabilitative setting

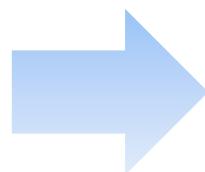

- Training
 - 1 month, 3 sessions per week training of MI-BCI
 - 1 month, 3 sessions/week training MI (no BCI)
- BCI Control features
 - affected hemisphere central, centro-parietal electrodes
 - Sensorimotor relevant frequency oscillations

BCI based training to practice MI – Results

Translational step: The Promotær

An all-in-one BCI-supported Motor Imagery training station, installed in the rehabilitation ward at Fondazione Santa Lucia

Training with the Promotoer

- 100 patients recruited (avg of 15 sessions per patients)
- Ischemic/Haemorragic Stroke (subacute and chronic); paresis/plegia of the upper limb due to a unilateral acquired brain lesion; Spinal Cord Injury (SCI, bilateral MI training)
- BCI training is performed in the context of the rehabilitation program of each patient
- Daily interaction with the clinical team

Training with the Promotoer - outlook

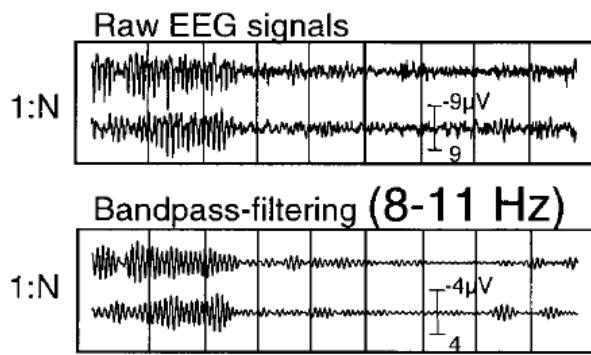

- Include hybrid (i.e. muscular) control features
- Implementing large clinical trial in rehabilitation ward(s):
 - To evaluate long term effect
 - To define best candidate
 - To isolate new control features
(brain-network derived)
- Evaluating effects on conditions other than stroke (eg. SCI) and on relevant clinical aspects other than motor function alone (eg: pain, spasticity)

EEG features for BCI

Neuroelectrical features for BCIs

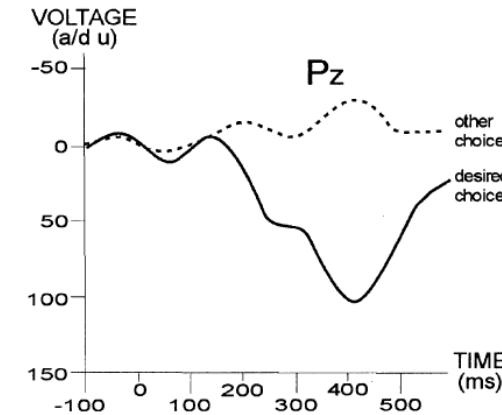

4 types of features of the EEG

ERD-ERS

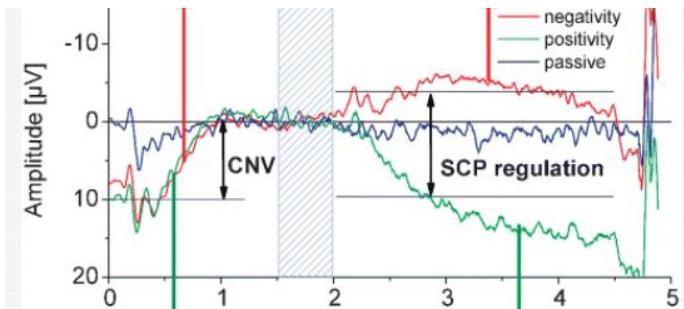

spontaneous EEG

Rhythms

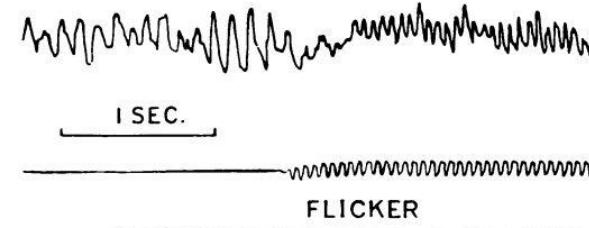

Evoked potentials

Slow Cortical Potentials

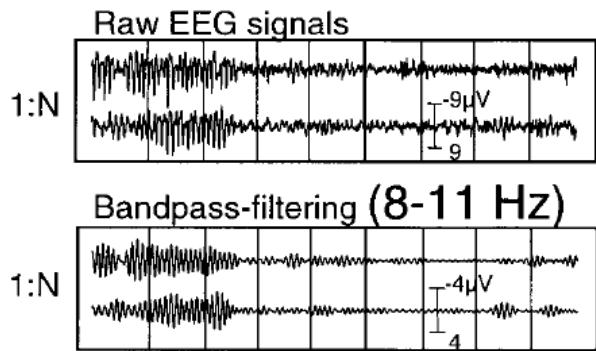

Evoked Potential
Steady-state EPs

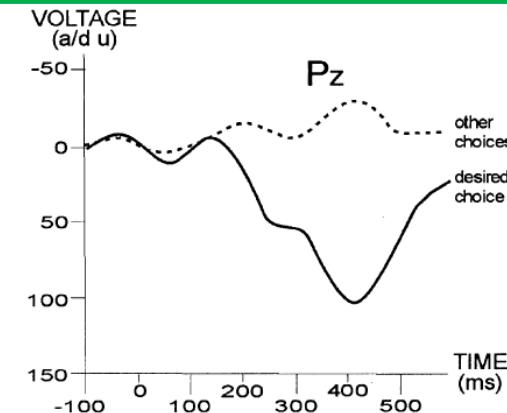

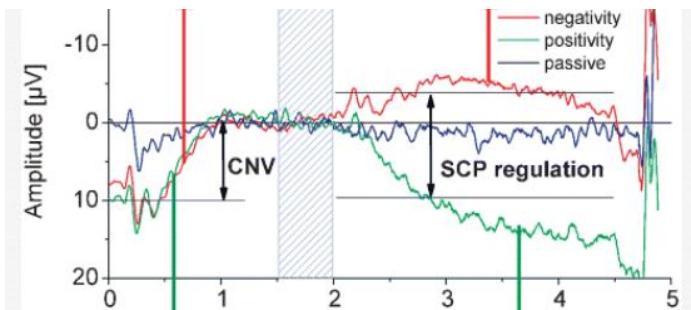

ELECTROENCEPHALogram FROM THE OCCIPITAL REGION,
SHOWING THE CHANGE FROM THE α RHYTHM TO THE FLICKER
RHYTHM WHEN THE EYES ARE OPENED AND THE SUBJECT LOOKS
AT A SCREEN LIT BY A FLICKERING LIGHT. THE RATE OF FLICKER
(17 A SECOND) IS SHOWN BY THE PHOTO-ELECTRIC CELL RECORD
BELOW.

Neuroelectrical features for BCIs

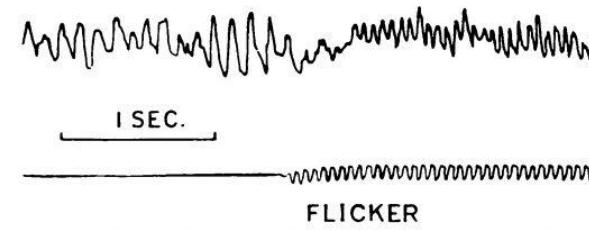

Rhythms

ELECTROENCEPHALogram FROM THE OCCIPITAL REGION, SHOWING THE CHANGE FROM THE α RHYTHM TO THE FLICKER RHYTHM WHEN THE EYES ARE OPENED AND THE SUBJECT LOOKS AT A SCREEN LIT BY A FLICKERING LIGHT. THE RATE OF FLICKER (17 A SECOND) IS SHOWN BY THE PHOTO-ELECTRIC CELL RECORD BELOW.

P300 Potential

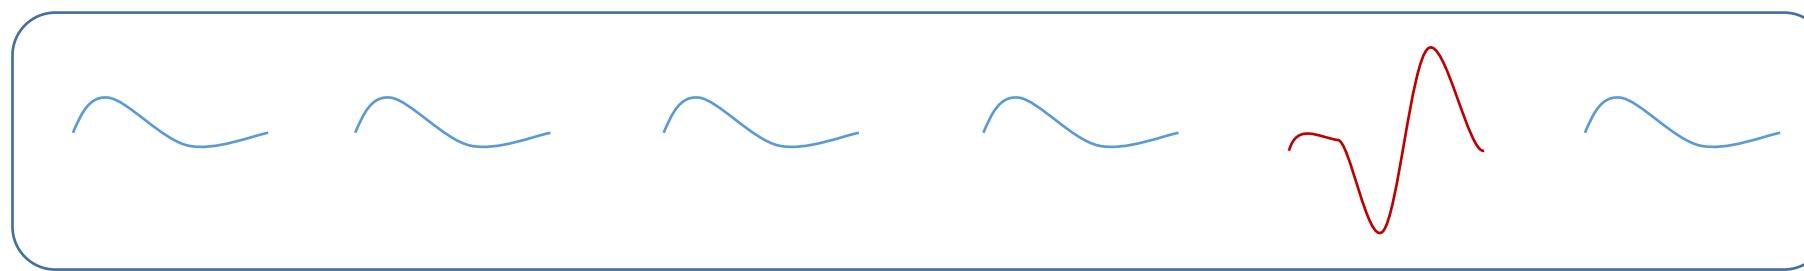

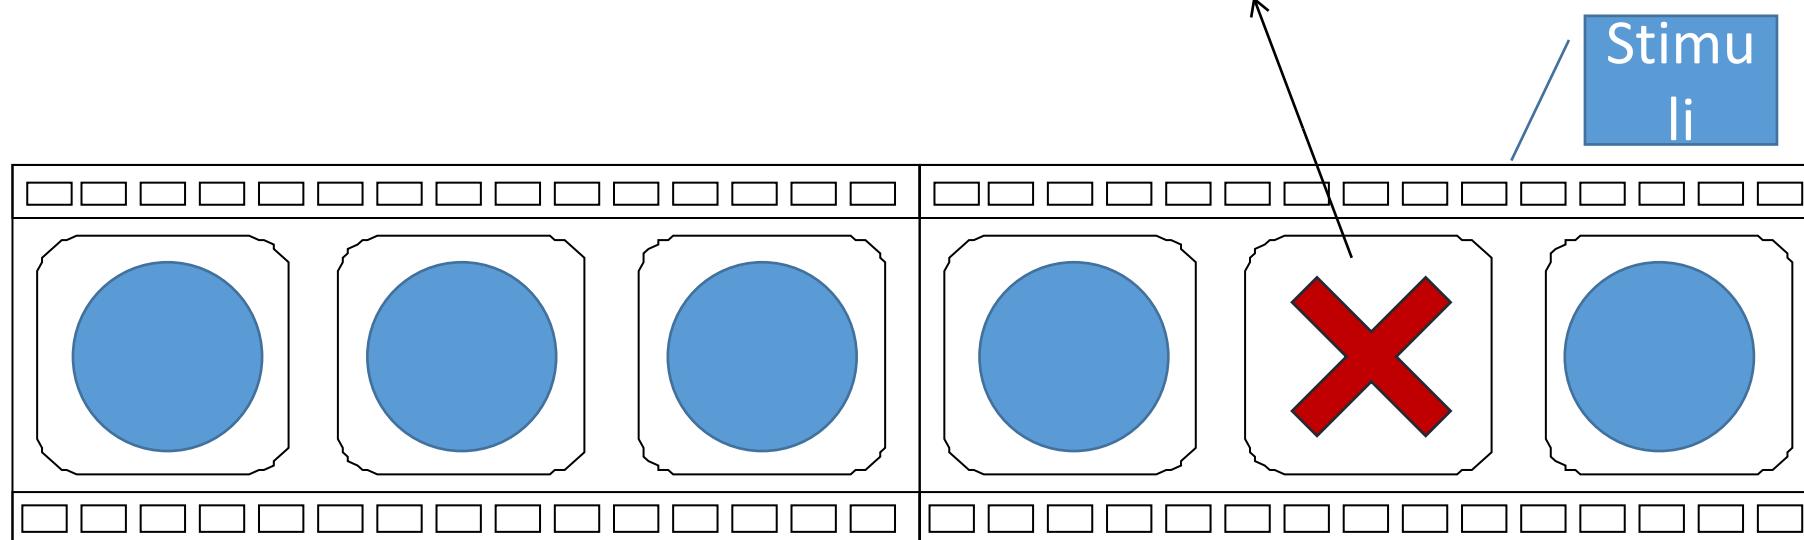

positive deflection around 300 millisec

- The P300 is an endogenous event-related potential (ERP) component in the EEG and occurs in the context of the “oddball paradigm”
- It follows unpredicted sensory stimuli or stimuli that provide salient (relevant) information
- Requires averaging to improve signal to noise ratio

From Sellers & Donchin 2006, clinph

Oddball stimulus

in this case the brain, not only responds because it has seen a stimulus, but it responds in a specific way because I deliver aware stimulus

Brain
responses

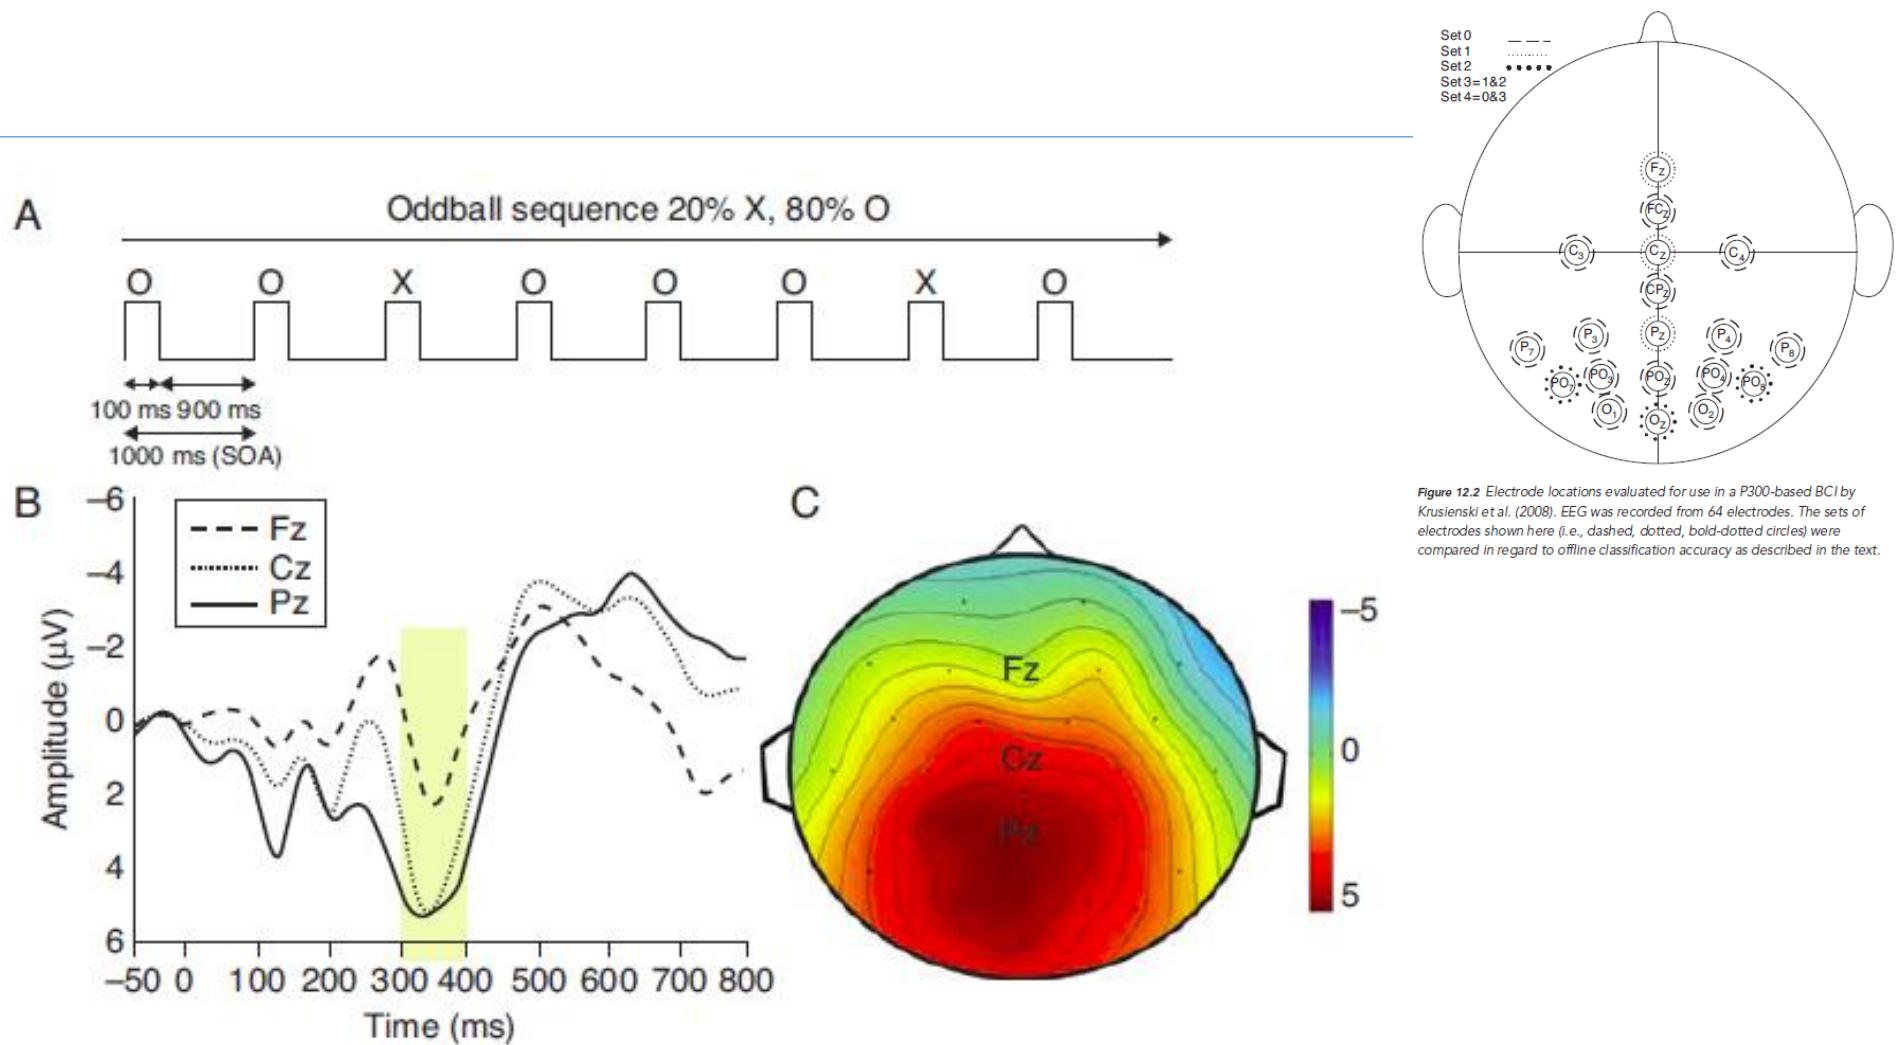

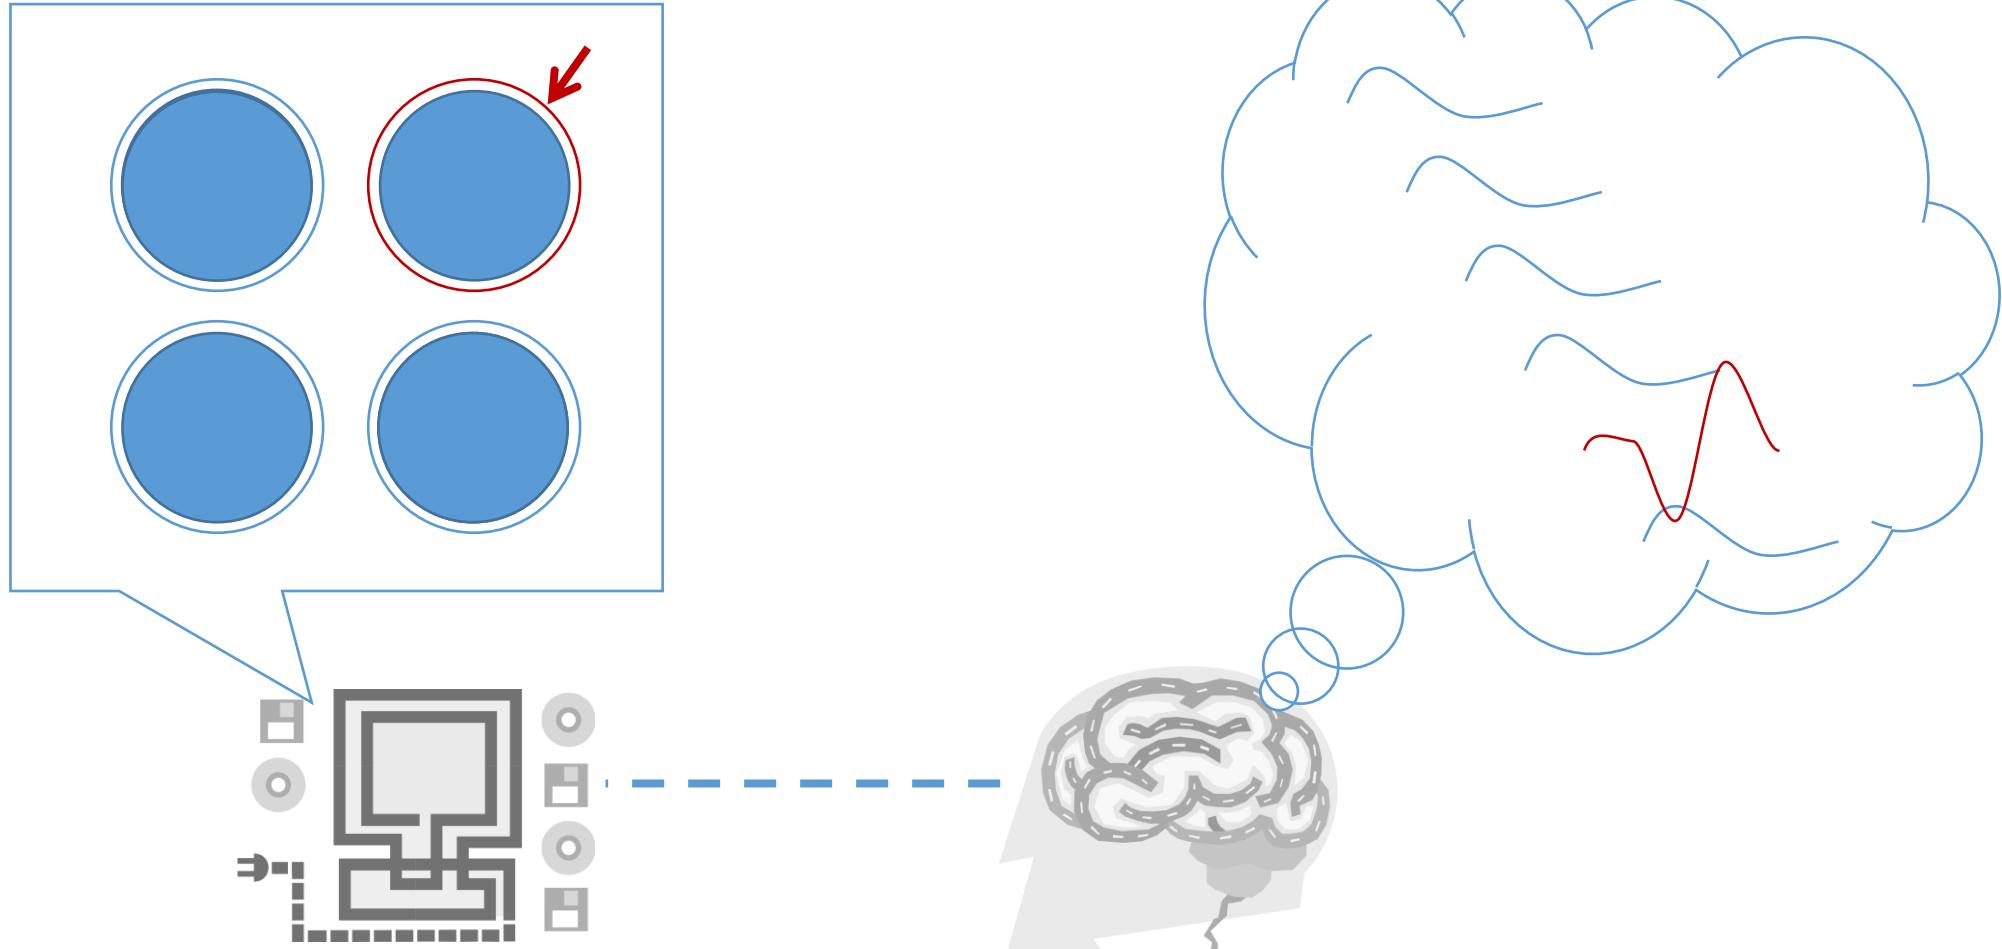

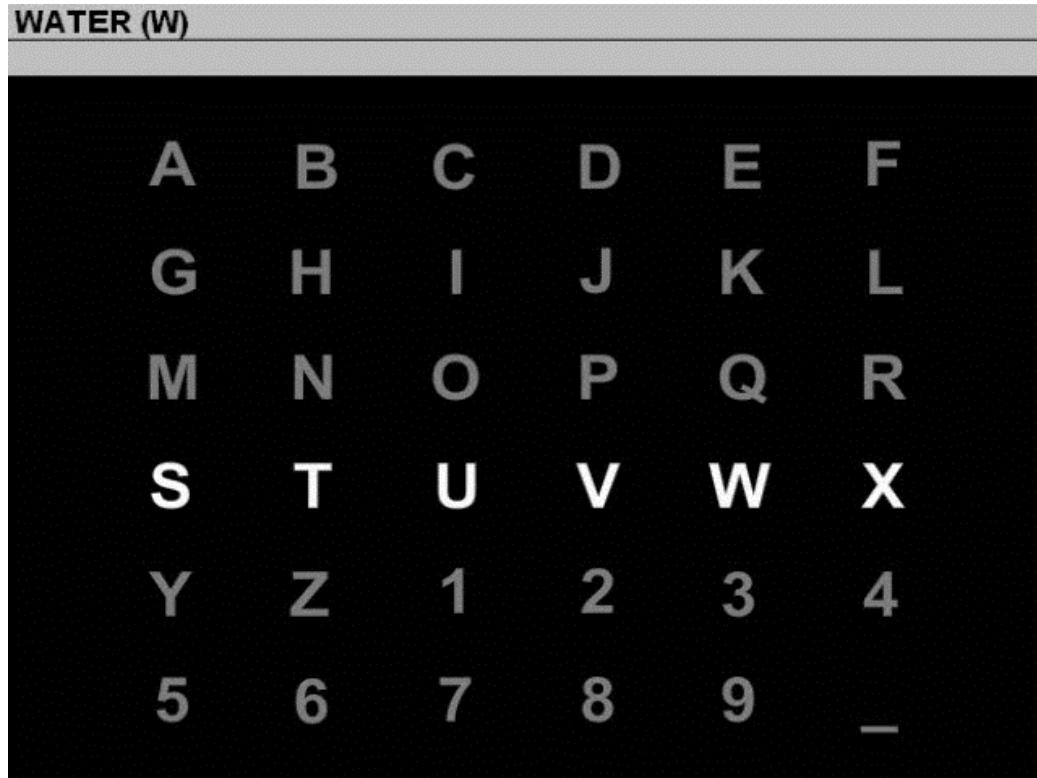

Figure 12.2 Electrode locations evaluated for use in a P300-based BCI by Krusienski et al. (2008). EEG was recorded from 64 electrodes. The sets of electrodes shown here (i.e., dashed, dotted, bold-dotted circles) were compared in regard to offline classification accuracy as described in the text.

Figure 12.1 (A). Time course of rare (i.e., oddball) (X) and common (O) stimuli in a standard oddball protocol. (B) Average oddball ERPs from a subject for electrode locations Fz, Cz, and Pz, showing a progressively larger positive deflection from frontal, to central, to posterior sites. The convention used here shows positive amplitude down and negative amplitude up. (C) Topographical distribution of the average ERP amplitude 300–400 msec after the oddball stimulus. The large positive ERP component (i.e., P300) is maximum at Pz and is widely distributed over posterior-parietal regions.

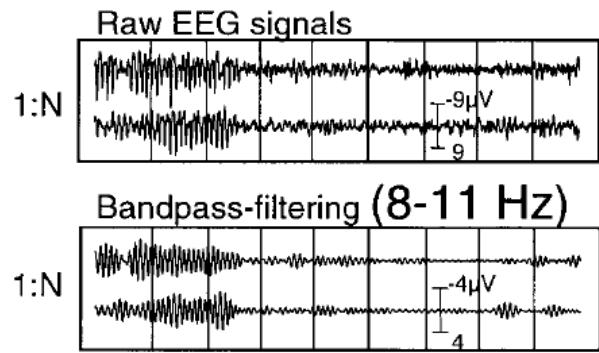

Relevant stimulus

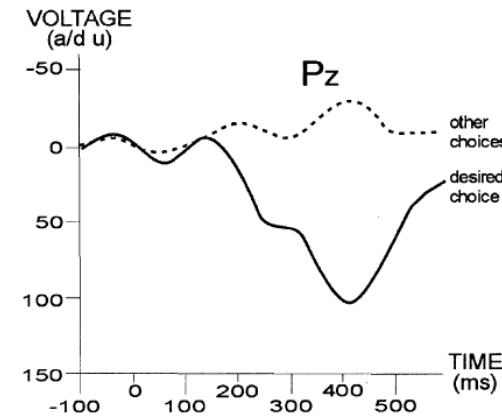

A BCI speller based on the P300 potential

Neuroelectrical features for BCIs

Sensorimotor Rhythms

- SMR is an oscillatory EEG detected on the central electrode sites (over the sensorimotor cortex)
- It is associated with inhibition of motor activity
- Reacts to execution and imagination of movement
- Tonic (i.e. stationary) and phasic (i.e. time-varying) spectral modulation

the grey line and the green line are superimposed in the alpha band, while the purple line is very desynchronized in the alpha band.

BCI basato sui ritmi sensorimotorio
